Online Questionnaire

Online

King's College London

The purpose of the project is to investigate how individual differences such as personality, mental health, well-being, loneliness, and autistic traits are related to quality of life in the general population. Quality of life for autistic people is often reported to be lower than members of the general population. We also want to explore how other variables, such as personality, loneliness, and difficulty identifying emotions (called 'alexithymia') are related to quality of life.
