

Call For Participants

antidepressants and
emotional processing about
the self

7 hour(s) to complete

£85

Experiment

Oxford OX1 2JD, UK

University of Oxford

We want to investigate whether a drug called 'citalopram', an antidepressant, changes how the brain deals with emotional and social information about the self and others, in healthy participants. Participants will be randomly assigned to take either citalopram or a placebo tablet, and then asked to complete some questionnaires and cognitive tasks on the computer. You will be asked to complete two sessions, taking approximately 7 hours in total.
