University of Leeds

'Hearing Aids for Music' aims to develop a better understanding of the music listening experiences of hearing aid users to inform future technologies and audiological processes. HA technologies have been developed primarily to process and amplify speech yet music plays an important role in many people's lives. Currently 1 in 7 of the population uses HAs and this is expected to increase to 1 in 5 by 2035 as a consequence of young people's listening habits and an ageing population.
