Loughborough University

More than 3.5 million people have been diagnosed with diabetes, while 12.3 million people are at increased risk of Type 2 diabetes in the UK (Diabetes UK).

Recent animal studies have pointed towards gut health playing a role in metabolic health, insulin sensitivity modulation, and thus diabetes risk. These findings have not been confirmed in humans yet.

We are conducting a study investigating the link between gut health (microbiota distribution and gut permeability) and metabolic health.
